

Testing a Toilet for Leaks

By Toiletology

Leaking toilets are the most common cause of high water bills. “One out of ten complaints from customers call about high water bills which can be traced to leaking toilets.” Customers tend to repair drippy faucets because the drips are visible and annoying. Whereas, it’s easier to overlook the leaking toilet.

There are a number of signs that a toilet needs some repairs, but many toilets leak without conspicuous indications of trouble. Here are some of the obvious signs of a leaking toilet:

- If you have to jiggle the handle to make a toilet stop running.
- Any sounds coming from a toilet that is not being used are sure signs of leaks.
- If you have to hold the handle down to allow the tank to empty.
- If you see water running over the top of the overflow, you definitely have a leaking refill valve. If you are unsure whether or not water is running over the top of the overflow pipe; sprinkle talcum powder on top of the water in the tank, and you can clearly see whether or not it is.
- If you can see water trickling down the side of the toilet bowl long after it’s been flushed.
- If water drips out of the refill tube into the overflow pipe.
- If a toilet turns the water on for 15 seconds or so without you touching the handle (otherwise known as the phantom flusher).

The Dye Test

However, even if your toilet doesn't have any of these symptoms it's still possible that it is leaking. These leaks are known as SILENT LEAKS, because they usually go undetected. There is an easy test you can do that will positively tell you whether or not your toilet is leaking. And if the test shows that the toilet is leaking, there is a second test that tells you what part inside the tank is responsible and needs fixing.

Remove the cover on the toilet tank and carefully set it aside so it can't be accidentally knocked over and cracked. Remove any "in-tank" bowl cleaners that color the water and begin the test with clear water in the tank as well as in the bowl.

You'll need some dye. Lee Lake can provide dye capsules or tablets, but food coloring, instant coffee or colored fruit drink mix works fine. Now put enough dye in the tank water to give the water a deep color. Wait 30 minutes. If you find any of the dyed water is now in the toilet bowl — your toilet is leaking. A properly operating toilet will store water in the tank indefinitely without any water running into the bowl.

Water on the floor around a toilet is certainly a problem. It can be dripping off a sweaty toilet tank during humid weather; it can mean the wax sealing ring under the bowl has disintegrated, or the bowl is cracked; or it can mean the connections under the tank are leaking.

Let's say you've done the dye test and found your toilet is leaking, you now have to find out which part is the culprit ... the flush valve or the refill valve. And there's another simple little test that points to the perpetrator of the crime.

Draw a pencil line on the back wall of the tank on the inside of the tank at the waterline. Then turn the water supply off, either under the tank or at the main shutoff — wait 20 to 30 minutes. If the water level remains at the pencil mark — the leak is occurring at the REFILL VALVE, the unit in the left side of the tank. If the water level falls below the pencil mark — the leak is in the FLUSH VALVE, the unit located in the center of the tank.
